

WORKFLOW OF POSTMAN

SEND A REQUEST

You start by sending a request using the postman to a web server or API endpoint

This could be a GET REQUEST to fetch data or a post request to send data

RECEIVE A RESPONSE: the sender (server sends) a response request for receiving a request from the postman

WRITING A SCRIPTS: using the postman script you can easily write a script and that script can be written to JavaScript

After receiving the script you can write test case for the script that you have received hence you analyse the response and write a test script according to that

Post request scripts: post request scripts can be used to asked for further operation, perform clean-up task or other operation

Iteration and Training: what we can do is we can provide multiple inputs for the same request and checked for the input we can checked the different responses we get from the SERVER
