- Postman is an application programming interface API Testing Tools
- API acts as an Interface in between a couple of application and establishes a connection between them
- Thus API is a collection of Agreements, Functions and Tools, we require APIs while accessing application for example checking news over the phone, Facebook etc.
- Postman is developed in the year 2012 by software developer and entrepreneur abhinav asthana to make API Development and testing straightforward
- API it can be used for design , documents ,verify and create them
- Postman have features of sending and observing hypertext transfer protocol (HTTP) , it has a guy and can be used in platforms like Linux , windows and mac
- It can be used to build multiple http request –POST , PUT , GET , PATCH and translate them into code

Four things are very important in postman

- Header
- Response
- Sidebar
- Builder

- POSTMAN can be installed in different so like windows , Linux and mac
- Postman can be installed from chrome extension it will be available on chrome
- And also it can be used as a standalone application
